Learn Programming

Well, most of the beginners face this problem in coding. Tutorials are fantastic and it teaches a lot of concepts or different approaches in coding to build something but when you start working on some real-world project you feel dissatisfied because you are unable to use all those concepts in your project. So the best advice to learn programming in 2020 is follow the project-based learning approach. Build as many projects as you can to strengthen your problem-solving skills in programming. Remember that programming is not about learning a language (Python, C++, Java, etc.), it is the ability to solve the problems. Also in a job, an employer needs a problem solver so, during interviews, your problem-solving skill comes first before anything else.
